Multi-center clinical research studies for Multiple Sclerosis

Abstract:

Multi-center clinical research studies are essential for advancing multiple sclerosis (MS) research by enabling large-scale investigations of disease mechanisms, progression, and treatment response. This talk will provide an overview of how multi-center MS studies are designed and conducted, covering key aspects such as cohort establishment, MRI harmonization, data quality, and longitudinal follow-up. It will also discuss the challenges and opportunities of collaborative research and highlight how large international cohorts are driving biomarker discovery and precision medicine in MS.
